ART UNIT

PAPER NUMBER

2192

NOTIFICATION DATE

DELIVERY MODE

07/25/2008

ELECTRONIC

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

JERRY.SHORMA@HP.COM  
mkraft@hp.com  
ipa.mail@hp.com

<b>Office Action Summary</b>	<b>Application No.</b> 10/786,843	<b>Applicant(s)</b> RIVERA ET AL.	
	<b>Examiner</b> ZHENG WEI	<b>Art Unit</b> 2192	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 10 April 2008.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1,4-11,14-21,24-31,34-41 and 44-49 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,4-11,14-21,24-31,34-41 and 44-49 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 25 February 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Remarks***

1. This office action is in response to the amendment filed on 04/10/2008.
2. Claims 1, 4, 10, 11, 14, 17, 20, 21, 24, 27, 30, 1, 34, 37, 40 and 41 have been amended.
3. Claims 1, 4-11, 14-21, 24-31, 34-41 and 44-49 remain pending and have been examined.

### ***Response to Arguments***

4. Applicant's arguments filed on 04/10/2008, in particular on pages 18-22, have been fully considered but they are not persuasive. For example:
  - At page 19, third paragraph, the Applicants argue that GNU fails to disclose or suggest using an assert method in an operating system and reporting an execution error as claimed in claim 1. The cited port of GNU appears to disclose using checks in programs for debugging problems with disclosing receiving an assertion from an executing program integral to an operating system to continue execution.

However, the Examiner respectfully disagrees.

First of all, as the Examiner indicated in the previous office action (p.3, first bullet and p.4-5), it is the Williams that discloses said limitation as the Applicants argued. The cited portion of GNU (as the secondary reference) is used to teach the limitation of "the executing process is integral to an operating

system” that is not explicitly disclosed by the primary reference Williams as indicated by the Examiner at previous office action last paragraph of page 3. However, because of the GNU is the same analogous art, the “checks” as cited in the GNU can also be used to check/assert the basic assumptions while executing the process as the Applicants argued. GNU discloses an example of checks (assert macro) (see for example, p.1, second paragraph) which is used to abort the program while printing a message about where in the program the error was detected. Therefore, the system does receiving “checks” assertion message (error message) during executing process (executing program).

- At page 19, last paragraph, the Applicants submit that GNU fails to disclose or suggest receiving an assertion from an executing process integral to an operating system and reporting an execution error as claimed in claim 1. Because the GNU appears to disclose checking for an “impossible” condition in a program which receives an error return from an operating system function. However, the Examiner respectfully disagrees. Because GNU reference is used to teach the limitation of “the executing process is integral to an operating system” that is not explicitly disclosed by the primary reference Williams. Moreover, it should be noted that the term “process” is well-known in the computer art which is an instance of program the operation system. Therefore assertion/checking condition in/from a program executing is the same as assertion/checking in/from an executing process.

- At page 20, second paragraph, the Applicants argue that GNU reference teaches aborting execution upon occurrence without allowing the executing process to continue execution.

However, the Examiner respectfully disagrees. Because GNU reference is used to teach the limitation of “the executing process is integral to an operating system” that is not explicitly disclosed by the primary reference Williams. It is the primary reference Williams as the Examiner indicated at office action page number 5, discloses said feature by function of the button labeled as “Ignore” for further continue execution.

- At page 20, last paragraph, the Applicants submit that the motivation to combine GNU with Williams is incorrect and fails to overcome Applicant's description at specification. However, it should be noted that claim language does not limit and/or require to meet such conditions.
- At page 21, second paragraph, the Applicants argue that PHP reference does not cure the deficiency of Williams and GNU.

The Examiner thanks the Applicants for pointing out related description in the specification. However, it should be noted that claim language does not limit the assertion type which is related to different amounts of processor resource.

Therefore, the “assert request type” active in PHP does read the claim limitation “recognizing an assertion request type corresponding to the assertion request” as cited in the claim.

- At page 21, sixth paragraph, the Applicants argue that PHP fails to disclose a determination of the component that source the assertion request. However, the Examiner's position is that PHP's functions "assert\_option()" /"assert()" are called/queried by the caller/process and the functions' return value automatically returns to the original caller (assertion request) and further can identify the component that sourced the assertion request.
- At page 21, last paragraph, the Applicants submits Williams reference does not disclose the limitation about "allowing the executing process to continue execution". Because the Figure 9-3 does not have supporting description. However, the Examiner respectfully disagrees. Figure 9-3 clearly shows a dialog box with the assert method that has "abort", "Retry" and "Ignore" buttons which can be used to abort/retry/ignore execution and the tile bar of the Figure 9-3, explicitly discloses that "Ignore" button is "Continue" [emphasis added] (see for example, Fig.9-3, title bar "Assertion Failed: Abort-Quit, Retry-Debug, Ignore-Continue"). Therefore, Williams does disclose said limitation as the Applicants argued.

### ***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

Art Unit: 2192

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 1, 4, 5, 7-11, 14, 15, 17-21, 24, 25, 27-31, 34, 35, 37-41 and 44-49 are rejected under 35 U.S.C. 103(a) as being unpatentable over by Williams (Mickey Williams, Microsoft® Visual C#™ .NET) in view of GNU (The GNU C Library, Section “Explicitly Checking Internal Consistency”) and in further view of PHP (PHP Manual, Section “assert\_options”)

**Claim 1:**

Williams discloses a method for monitoring (debugging and tracing) computer software comprising:

- receiving an assertion from an executing process (see for example, p.11, line 3, “When a DefaultTraceListerner object detects that the Assert method has been called from a server process”), but does not explicitly disclose wherein the executing process is integral to an operating system. However, GNU in the same analogous art of application/operating system error checking discloses using assert method in the operating system and report execution error (see for example, p.1, section “Explicitly Checking Internal Consistency”, first paragraph and p.2 third paragraph, “check for an error return from an operating system function”). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to put the assertion in the operation system code to monitor the error from the system call. One would have been motivated to do so to display all the error information and further help to debug problem as suggested by GNU (see for

example, p.1, section “Explicitly Checking Internal Consistency”, first paragraph, “These kinds of checks are helpful in debugging problem...”). wherein receiving an assertion comprises:

- receiving an assertion request (see for example, p.11, line 3, “When a DefaultTraceListerner object detects that the Assert method has been called from a server process”);  
  
But neither of them explicitly discloses about recognizing a type for assertion request. However, PHP in the same analogous art of assertion, discloses a assert control option (see for example, p.1, Table 1. Assert Options, “assert.active” and “default value 1” for enabling assert() evaluation and related text). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to assertion control option with assert method in Williams to control monitoring process. One would have been motivated to do so to set the various assert() control options as suggested by PHP (see for example, p.1, “Using assert\_options() you may set the various assert() control options...” ) or
- accepting the assertion request when the determined component has assertion requests enabled (see rejection above for the assert\_option is set to 1 (enable assert() evaluation)).
- recording the assertion when the assertion is violated (see for example, p.10-11, figure 9-3 “Dialog box generated by trace and debug output with the

- Assert method” and related text, also see p.10, section “Asserting That Expressions Are True”, lines 15-16, The Assert method is used to display an error message when a condition that’s expected to evaluates as true evaluates as false.”); and
- allowing the executing process to continue execution (see for example, p.10-11, figure 9-3”Dialog box generated by trace and debug output with the Assert method” and button labeled as “Ignore”).

**Claim 4:**

Williams further discloses the method of claim 1 wherein recording the assertion comprises recording a datum that includes at least one of: type of assertion, sequence number of the assertion, time at which the assertion occurred, identification of processor that produced the assertion, identification of process that produced the assertion, identification of the thread that produced the assertion, text of the assertion, stack trace, source line containing the assertion, and file name of the source containing the code that generated the assertion ( see for example, p.10-11, figure 9-3 ”Dialog box generated by trace and debug output with the Assert method” and related text, also see p.10, lines 1-2, “As you can see, this dialog box includes call stack information when available. Where debug symbols are available, the stack trace includes file name and line number information.”)

**Claim 5:**

Williams also discloses the method of claim 1 wherein recording the assertion comprises writing information regarding the assertion violation to a computer readable medium (see for example, p.9, lines 13-15, “The .NET Framework includes classes to control trace and debug output message and to write output message to files, streams, and event log.”).

**Claim 7:**

Williams further discloses the method of claim 1 further comprising:

- accepting a command from at least one of a control console and a network connection (see for example.p.203, Figure 9-1. “The build property page for a project, on which new symbols are defined”, “TraceDemo Property Pages”, “Configuration Properties”, also see p.13, example configuration file: *SwitchText.exe.config* ); and
- updating an enable condition for an assertion class according to the command (see for example, p.13, line 41-p.14, line 2, “Switches are controlled by adding XML element nodes inside the switches element, Multiple switch objects can be configured through a configuration file by adding additional elements to the switches node.” , “BooleanSwitch objects are disabled by default and are enabled if they’re assigned a nonzero value in a configuration file.”)

**Claim 8:**

Williams further discloses the method of claim 1 further comprising generating an error report according to the recorded assertion (see for example, p.11, lines 7-17. “The Assert method has three versions”, “The most basic version simply accepts an expression that triggers an assertion failure message”, “The second version of Assert accepts a second parameter that serves as a short error message describing the assertion violation”, “The third version of Assert accepts a third parameter that includes detailed information about the assertion violation”)

**Claim 9:**

Williams also disclose the method of claim 8 further comprising dispatching the error report to a real-time assertion monitor (Visual Studio output window) (see for example, p.11, lines 5-6, “Instead, it writes the output message to the Visual Studio Output window and any other debuggers currently accepting output from the Microsoft Win32 OutputDebugString function.”).

**Claim 10:**

Williams further discloses the method of claim 8 wherein generating an error report comprises: retrieving an assertion violation parameter including at least one of: type of assertion, sequence number of the assertion, time at which the assertion occurred, identification of processor that produced the assertion, identification of process that produced the assertion, identification of the thread

that produced the assertion, text of the assertion, stack trace, source line containing the assertion, and file name of the source containing the code that generated the assertion; and generating a report file comprising page description statements according to the assertion parameter (see for example, p.10-11, figure 9-3 "Dialog box generated by trace and debug output with the Assert method" and related text, also see p.10, lines 1-2, "As you can see, this dialog box includes call stack information when available. Where debug symbols are available, the stack trace includes file name and line number information.")

**Claims 11, 14, 15, 17-20 and 45:**

Claims 11-15, 17-20 and 45 are apparatus version of the claimed method addressed in claims 1-5, 7-10 and 44 above for monitoring computer software, wherein such an apparatus/computer system is deemed to be inherent to produce, such as Figure 9-3 dialog box and word above. Therefore, these claims are also anticipated by Williams.

**Claims 41 and 49:**

See the rejection in claim 1 above.

**Claim 44:**

Williams also discloses the method of Claim 1 wherein the assertion request type is one of a group of defined assertion macro names (property) (see for example,

p.13, section "Using the BooleanSwitch Class", lines 20-21, "The BooleanSwitch class is used to created simple Switch objects that can be either enable or disabled", also see p.22-24, example code)

**Claim 48:**

Williams also discloses the apparatus for monitoring computer software of Claim 41 wherein the assertion request type is one of a group of defined assertion macro names (property) (see for example, p.13, section "Using the BooleanSwitch Class", lines 20-21, "The BooleanSwitch class is used to created simple Switch objects that can be either enable or disabled", also see p.22-24, example code).

**Claims 21, 24, 25, 27-30 and 46:**

Claims 21-25, 27-30 and 46 claim a computer software monitoring system comprising: memory capable of storing instructions; processor capable of executing instructions stored in the memory; and software monitor instruction sequence that, when executed by the processor, minimally causes the processor to: receive an assertion from an executing process, record the assertion, and allow the executing process to continue execution. This is a product version of method claims discussed in claims 1-5 and 7-10 above respectively. It is well known in the computer art that the method can be practiced by the computer system to perform the same functionality. Therefore, these claims are also unpatentable over Williams, GNU and PHP.

**Claims 31, 34, 35, 37-40 and 47:**

Claims 31-35, 37-40 and 47 claim a computer-readable medium having computer-executable instructions for performing a method for monitoring computer software. This is another product version of method claims discussed in claims 1-5 and 7-10 above respectively. It is well known in the computer art that the method can be stored and practiced in the computer-readable medium. Therefore, these claims are also unpatentable over Williams, GNU and PHP.

7. Claims 6, 16, 26 and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Williams (Mickey Williams, Microsoft® Visual C#™ .NET) in view of GNU (The GNU C Library, Section “Explicitly Checking Internal Consistency”) in further view of PHP (PHP Manual, Section “assert\_options”) and in further view of Cantrill (Bryan M, Cantrill, US 7,146,473)

**Claim 6:**

Williams, GNU and PHP disclose the method of claim 1 wherein recording the assertion comprises writing information regarding the assertion violation to output device, but does not explicitly disclose the output is a circular buffer. However, Cantrill in the same analogous art of a mechanism for ring buffering (circular buffer) in an arbitrary-action tracing framework (see for example, col.7, lines 15-17, “Embodiments of the invention provide a means for implementing a ring buffer scheme in arbitrary-action tracing frameworks which have variable length

records.”). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to use circular buffer to store the output message. One would have been motivated to do so to keep the most recent recorded message in the fix sized buffer as suggested by Cantrill (col.1, lines 28-30, “one may which only want to keep the most recent data. To allow for this, tracing frameworks have historically implemented ring buffer.”)

**Claims 16, 26 and 36:**

Claims 16, 26 and 36 are different product versions of method claim 6. It is well known in the computer that these products can be used to practice or perform the method discussed in claim 6 above. Therefore these claims are also unpatentable over Williams, GNU and PHP in view the teachings of Cantrill.

***Conclusion***

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Applicant's arguments with respect to claims rejection have been considered but they are not persuasive. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Zheng Wei whose telephone number is (571) 270-1059 and Fax number is (571) 270-2059. The examiner can normally be reached on Monday-Thursday 8:00-15:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tuan Q. Dam can be reached on (571) 272-3695. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Any inquiry of a general nature of relating to the status of this application or proceeding should be directed to the TC 2100 Group receptionist whose telephone number is 571- 272-1000.

Art Unit: 2192

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
